

Simplify provisioning, identity and **access management.**

Efficiently manage how users authenticate to devices and access resources and apps.

The increase of remote work means devices, users and data are everywhere. On-premises Active Directory and legacy VPNs often fall short when jobs are increasingly performed in cloud-based environments, outside of the corporate network. This is especially true for mobile devices, since legacy VPNs are often not mobile-friendly. Effectively managing user identities and granting secure remote access to company data is a challenge without the right purpose-built solutions.

Enter Jamf Connect.

Jamf Connect simplifies how organizations provision and authenticate users and devices. It also eases login processes and provides Zero Trust Network Access (ZTNA) to secure corporate resources anywhere users are working.

Jamf streamlines provisioning and solves identity and access management challenges.

Jamf Connect brings cloud identity workflows to the Mac and enables Zero Trust Network Access (ZTNA) for Mac and mobile devices.

Account provisioning and authentication

Jamf Connect uses a singlecloud identity across devices and applications, providing an improved experience during setup and day-to-day logins.

Modern remote access anywhere

Jamf Connect provides continuous encrypted and secure connections to company resources that move freely with users throughout their day, while protecting their privacy.

Continuous conditional access

Jamf Connect uses risk-aware access policies and per-app connections, delivering zero trust access to the work apps and data that employees need to be productive.

End user experience

Users can view their account information, reset their password and authenticate in the end user portal Self Service+.

Password synchronization on macOS

Jamf Connect keeps account credentials in sync between devices and cloud identity providers (even when the password is changed), reducing password fatigue, IT help desk tickets and user downtime.

Consistent access controls

Jamf Connect lets you centralize all access control around an existing identity provider, bringing consistent access policy across all of workflows, from local Mac accounts to remote access of work apps.

Privilege Elevation on macOS

Jamf Connect allows administrators to make macOS users standard by default and temporarily grant administrator privileges to accomplish specific tasks. Privilege Elevation can require Cloud IdP authentication, specific user group membership and can be limited to specific time durations.

With key identity provider integrations, Jamf Connect is the best way to manage accounts and authentication.

✔ Okta ✔ Microsoft Entra ID ✔ Google Cloud Identity ✔ IBM Security Verify ✔ OneLogin ✔ PingFederate

Implementing a provisioning, identity and access management strategy that is Apple-first, Apple-best, reduces complexity, improves the user experience, and limits security gaps, all while enhancing an already powerful Apple framework – enabling work from anywhere.
